NITROGEN MUSTARD PRODRUGS WITH NOVEL LIPOPHILIC PROTECTING GROUPS, AND PROCESSES FOR THEIR PRODUCTION

The present invention relates to prodrugs and their use in the treatment of disease, including cancers.

5 The use of prodrugs represents a clinically very valuable concept in cancer therapy since, particularly where the prodrug is to be converted to an anti-tumour agent under the influence of an enzyme that is linkable to a monoclonal antibody that will bind to a tumour associated antigen, the combination of such a prodrug with such an enzyme monoclonal/antibody conjugate represents a very powerful clinical agent. This approach to cancer therapy, often referred to as "antibody directed enzyme/prodrug therapy" (ADEPT) is disclosed in WO88/07378.

10 More recently, a similar approach ("GDEPT", Gene-Directed Enzyme Prodrug Therapy) has been proposed where in place of an antibody/enzyme conjugate, tumour cells are targeted with a viral vector carrying a gene encoding an enzyme capable of activating a prodrug. The gene may be transcriptionally regulated by tumour specific promoter or enhancer sequences. The viral vector enters tumour cells and expresses the enzyme, in order that a prodrug is
15 converted to an active drug only in the vicinity of the tumour cells (Huber et al. Proc. Natl. Acad. Sci. USA (1991) 88, 8039). The enzyme may be targeted to particular subcellular locations or expressed at the cell surface.

The present invention provides novel prodrugs which contain protecting groups which are more lipophilic than compounds of the prior art such as those disclosed in WO88/07378.

20 Accordingly, the present invention provides compounds of the formula (I):

wherein X and Y are independently chlorine, bromine, iodine, a mesyl group CH_3SO_2 or a tosyl group $\text{OSO}_2\text{phenyl}$ (wherein phenyl is optionally substituted by 1, 2, 3, 4 or 5 substituents independently selected from C_{1-4} alkyl, halogen, cyano or nitro;

These prodrugs can be activated at the site of a tumour by a carboxypeptidase enzyme, for example, CPG2 as disclosed in WO88/07378 or WO94/02450. The carboxypeptidase enzyme may be delivered to the site of a tumour by a GDEPT system as described in the prior art.

20 A carboxypeptidase enzyme is capable of removing the glutamic acid or glutamic acid-derivative moiety (which are preferably in the L-configuration) of compounds of the formula (I). While not wishing to be bound by any one particular theory, it is believed the removal of the glutamic acid moiety from the compounds produces an unstable intermediate compound which undergoes self-immolation to remove the 4-amino or 4-hydroxyl-benzylic system

25 (situated between the groups Z¹ and Z²) thus leading to the release of the alkylating nitrogen mustard drug.

CPG enzyme is available from Sigma Chemical Company, Fancy Road, Poole, Dorset, U.K. CPG enzyme was described in: Goldman, P. and Levy, C.C., PNAS USA, 58: 1299-1306 (1967) and in: Levy, C.C. and Goldman P., J. Biol. Chem., 242: 2933-2938 (1967).

30 Carboxypeptidase G3 enzyme has been described in Yasuda, N. *et al.*, Biosci. Biotech.

Biochem., 56: 1536-1540 (1992). Carboxypeptidase G2 enzyme has also been described in European Patent 121 352.

Large scale purification of CPG2 from Pseudomonas RS-16 was described in Sherwood *et al.* (1985), Eur. J. Biochem., 148, 447-453.

CPG2 may also be obtained by recombinant techniques. The nucleotide coding sequence for CPG2 has been published by Minton, N.P. *et al.*, Gene, 31 (1984), 31-38. Expression of the coding sequence has been reported in *E.coli* (Chambers, S.P. *et al.*, Appl. Microbiol. Biotechnol. (1988), 29, 572-578) and in Saccharomyces cerevisiae (Clarke, L. E. *et al.*, J. Gen Microbiol, (1985) 131, 897-904). Total gene synthesis has been described by M. Edwards in Am. Biotech. Lab (1987), 5, 38-44.

The present invention further provides nitrogen mustard prodrugs of the formula (II):

wherein X, Y, R¹, n, Z¹, R² and m are as defined for compounds of the formula (I), and physiologically acceptable derivatives thereof.

These prodrugs can be activated at the site of a tumour by a nitroreductase enzyme, for example, as disclosed in WO93/08288. The nitroreductase enzyme may be delivered to the site of a tumour by a GDEPT system as described in the prior art.

Physiologically acceptable derivatives of said prodrugs of formulae (I) and (II) include salts, esters and salts of esters. Esters include carboxylic acid esters in which the non-carbonyl moiety of the ester grouping is selected from straight or branched chain C₁₋₆alkyl, (methyl,

n-propyl, n-butyl or t-butyl); or C₃₋₆cyclic alkyl (e.g. cyclohexyl). Salts include physiologically acceptable base salts, eg derived from an appropriate base, such as alkali metal (e.g. sodium), alkaline earth metal (e.g. magnesium) salts, ammonium and NR₄ (wherein R is C₁₋₄ alkyl) salts. Other salts include acid addition salts, including the hydrochloride and acetate salts.

Preferred values of X and Y are independently chloro, iodo and mesyl.

Preferably, n either is zero or is 1 or 2 and the group(s) R¹ are independently fluorine, chlorine, bromine, iodine or C₁₋₄ alkyl. Similarly, it is preferred that either m is zero or is 1 or 2 and the group(s) R² are independently fluorine, chlorine, bromine, iodine or C₁₋₄ alkyl.

10 R³ is preferably hydrogen.

Z² is preferably a group -V-W where V is -CH₂CH₂- and W is a group -COOH, -(C=O)-OR⁶ where R⁶ is as defined above, or -(C=O)-NR⁷R⁸ where R⁷ and R⁸ are independently hydrogen or C₁₋₆ alkyl.

15 Preferred compounds of the formula (I) are those in which Z¹, Z², n and m are as defined above, and:

X and Y are independently selected from chloro, iodo or mesyl;

each phenylene group which may be optionally substituted by R¹ and R² is unsubstituted or if either is substituted, the group(s) R¹ and/or R² are independently selected from fluorine, chlorine, bromine, iodine or C₁₋₄ alkyl;

20 R³ is hydrogen; and

Z³ is a group -CH₂CH₂-COOH.

Compounds of the formula (I) which are especially preferred are those in which X and Y independently represent iodo or chloro; n and m are both zero;

R₁ represents hydrogen; Z₁ and Z₂ each independently represent -NH- or -O-; and Z₃

25 represents CH₂CH₂COOH.

Preferred compounds of the formula (II) are those in which Z^1 is -O- or -NH-. X and Y are
The independently selected from iodo and mesyl, each phenylene group which may be
optionally substituted by R^1 and R^2 is unsubstituted or if either is substituted, the group(s) R^1
and/or R^2 are independently selected from fluorine, chlorine, bromine, iodine or C_{1-4} alkyl,
5 most preferably fluorine, and in which case n and/or m are 1 or 2.

Compounds of the formula (II) which are especially preferred are those in which X represents
iodo; n represents zero; Z^1 represents -O- or -NH-; R_2 represents hydrogen or fluorine; and
m represents an integer from 1 or 2.

The invention further provides pharmaceutical formulations. Such formulations comprise a
10 compound of formula (I) or (II) together with one or more pharmaceutically acceptable
carriers or diluents.

Pharmaceutically acceptable carriers or diluents include those used in formulations suitable
for oral or parenteral (e.g. intramuscular or intravenous) administration. The formulations
may conveniently be presented in unit dosage form and may be prepared by any of the
15 methods well known in the art of pharmacy. Such methods include the step of bringing into
association the active ingredient with the carrier which constitutes one or more accessory
ingredients. In general the formulations are prepared by uniformly and intimately bringing
into association the active ingredient with liquid carriers or finely divided solid carriers or
both, and then, if necessary, shaping the product.

20 For example, formulations suitable for parenteral administration include aqueous and non-
aqueous sterile injection solutions which may contain anti-oxidants, buffers, bacteriostats and
solutes which render the formulation isotonic with the blood of the intended recipient; and
aqueous and non-aqueous sterile suspensions which may include suspending agents and
thickening agents, and liposomes or other microparticulate systems which are designed to
25 target the polypeptide to blood components or one or more organs.

Suitable liposomes include, for example, those comprising the positively charged lipid (N[1-(
(2,3-dioleoyloxy)propyl]-N,N,N-triethylammonium (DOTMA), those comprising dioleoyl-

phosphatidylethanolamine (DOPE), and those comprising 3β [N-(n',N'-dimethylaminoethane)-carbamoyl]cholesterol (DC-Chol).

In GDEPT the prodrug will usually be administered following the administration of a delivery system containing the gene encoding the enzyme. This includes administration of a modified virus encoding an enzyme. Typically, the virus will be administered to the patient and then the uptake of the virus by infected cells monitored, for example by recovery and analysis of a biopsy sample of targeted tissue.

A wide range of viral delivery systems for gene therapy are known in the art. For example EP-A-415 731 describes molecular chimeras comprising a promoter which may be activated in a tumour cell is operably linked to a heterologous gene encoding an enzyme capable of converting a prodrug into a cytotoxic agent. Such molecular chimeras may be used to express carboxypeptidase or nitroreductase in tumour cells, in order to activate prodrugs of the invention. EP-A-415 731 describes incorporation of such molecular chimeras into viral vectors, e.g. adenoviral or retroviral vectors. Such viral vectors may also be adapted for utilization in the present invention.

Other recombinant viral vector delivery systems are described in WO91/02805, WO92/14829, WO93/10814, WO94/21792, WO95/07994 and WO95/14091 the disclosures of which are incorporated herein by reference. Methods for producing vector delivery systems based on the above-mentioned disclosures may be used to deliver vectors encoding nitroreductase or carboxypeptidase to target cells.

The exact dosage regime for GDEPT will, of course, need to be determined by individual clinicians for individual patients and this, in turn, will be controlled by the exact nature of the prodrug and the cytotoxic agent to be released from the prodrug but some general guidance can be given. Chemotherapy of this type will normally involve parenteral administration of both the prodrug and the enzyme or a vector encoding the enzyme and administration by the intravenous route is frequently found to be the most practical.

In GDEPT systems, the amount of vector delivered will be such as to provide an effective cellular concentration of enzyme so that the prodrug may be activated in sufficient

concentrations at the site of a tumour to achieve a therapeutic effect, e.g. reduction in the tumour size. This may be determined by clinical trials which involve administering a range of trial doses to a patient and measuring the degree of infection or transfection of a target cell or tumour. The amount of prodrug required will be similar to or greater than that for ADEPT systems of the type mentioned above. For example, suitable dose of prodrugs in such systems are described in Bagshawe *et al*, 1991 in Antibody, Immunoconjugates and Radio-Pharmaceuticals I. 915-922. Such doses eg. from 5 to 2000 mg/m² (eg about 200 mg/m² per dose (eg every one or two days or weekly) of prodrugs of the invention may be used, although doses outside this range may be used at the discretion of the physician.

10 The present invention also provides a system for use in the control of neoplasia in a human or animal subject comprising a vector or other delivery system capable of selectively infecting tumour cells in said subject, said vector carrying a DNA or RNA sequence encoding an enzyme, in association with a prodrug of formula (I) or (II) capable of being converted to a nitrogen mustard compound by the action of said enzyme.

15 The present invention extends to a method of treating neoplasia in a human or animal subject requiring such treatment which comprises administering to the host an effective amount of a prodrug of the invention and a modified virus, said modified virus capable of selectively infecting tumour cells in said subject, said virus carrying a DNA or RNA sequence encoding an enzyme capable of converting said prodrug to an active nitrogen mustard compound.

20 The present invention also extends to a method of treating neoplasia in a human or animal subject requiring such treatment which comprises administering to the host an effective amount of a prodrug of the invention and a non viral vector system, said non-viral vector system capable of being selectively introduced into tumour cells in said subject, said vector system carrying a DNA or RNA sequence encoding an enzyme capable of converting said
25 prodrug to an active nitrogen mustard operably linked to a promoter effective in expressing said enzyme in said cells.

Vectors capable of selectively infecting tumour cells are known in the art. By "selectively infecting" it is meant that the vector, for example a modified virus, will primarily infect tumour cells and that the proportion of non-tumour cells infected is such that the damage to

non-tumour cells by administration of the prodrug will be acceptably low, given the nature of the disease being treated. Ultimately, this will be determined by the physician.

It will also be understood that the DNA or RNA sequence encoding an enzyme carried by the virus will be linked to suitable expression control signals such that expression of the enzyme
5 will occur in the targeted tumour cells.

Non-viral vector systems will be capable of being selectively introduced into tumour cells utilizing methods such as those mentioned above, e.g. calcium phosphate co-precipitation, microinjection, liposomes, direct DNA uptake, and receptor-mediated DNA transfer (Morgan & French Anderson, *Annu. Rev. Biochem.*, 1993, 62;191).

10 Prodrugs of the present invention may also be used as reagents in *in vitro* systems to test the activity of candidate enzymes which may be incorporated into GDEPT systems.

For example, a tumour cell may be infected or transfected *in vitro* by a vector containing an enzyme. The enzyme will be one which is, or suspected to be, capable of converting a prodrug of the invention into an active drug. The prodrug is then added to the culture and
15 the amount of cell killing or inhibition of cell growth is measured (for example by using a vital stain to record the number of viable cells or by replating a sample of the culture to count the number of viable cells). This model system may also be used to test the toxicity, activity or selectivity of compounds of the present invention against a range of tumour cell types suitable tumour cells for use in these model systems include ovarian, colon, glioma, breast,
20 small cell and non-small cell lung cancer cells, and melanomas.

The invention further provides processes for the production of compounds of formulae (I) and (II). Thus the invention provides a process for the production of a compound of formula (I) as defined above which comprises reacting a compound of the formula (III)

in which X, Y, R¹ and n are as defined for formula (I) and Z⁴ is -O- or -NH- with a compound of formula (IV)

in which R², m, Z², Z³ and R³ are as defined above, and Q is a leaving group. The reaction may be performed in an aprotic solvent and in the presence of a base. The invention also provides a process for the production of compounds of the formula (II) which comprises reacting a compound of formula (III) as defined above with a 4-nitrobenzyl chloroformate optionally substituted with from 1 to 4 group(s) R² as defined above.

The invention further provides compounds of the formula (IV);

in which R^2 , m , Z^2 , R^3 and Z^3 are as defined above for compounds of the formula (I), and Q is a leaving group, with the proviso that when R^2 is fluorine, chlorine, bromine, iodine, hydroxy, mercapto, amino, nitro, C_{1-4} alkyl, C_{1-4} haloalkyl, C_{1-4} alkoxy, C_{1-4} haloalkoxy, C_{2-4} alkenyl, C_{2-4} alkynyl, and C_{2-4} haloalkenyl, R^3 is hydrogen or a C_{1-6} alkyl group, and Z^3 is a group $-CH_2CH_2COOX^{10}$ where X^{10} is hydrogen or a C1-6alkyl group, then Q is not a N-succinimidyl group. These compounds are useful as linkers which may be attached to active cytotoxic compounds to provide prodrugs of said compounds with increased lipophilicity. The compounds of formula (IV) may be linked to such cytotoxic compounds via free $-OH$ or $-NH_2$ groups on such compounds, using methods and reactions described below, or modified using routine experimentation.

Such protected cytotoxic compounds may be useful in GDEPT methods, or *in vitro* assays used to study such methods.

Brief Description of the Drawings

Figure 1 provides a reaction scheme used to make the compounds described in Example 9.

Figure 2 provides a reaction scheme used to make the compounds described in Example 15.

Figure 3 provides a reaction scheme used to make the compounds of the invention described in Examples 1, 2, 3 and 4.

Compounds of the invention may be made using reactions and methods known per se in the art of chemistry. The following methods are of particular use, and are further illustrated by reference to the Examples where indicated. Such reference does not limit the general reaction schemes to those compounds alone. The schemes may be used for other compounds of the invention:

A: Compounds of formula (I) where Z^1 is $-O-$:

(i) Compounds of formula (I) in which $Z^1 = -O-$ and $Z^2 = -NH-$, may be prepared by the reaction of a nitrogen mustard of formula (III)

wherein X, Y, R^1 and n are as defined above and Z^4 is $-O-$ with a linker of formula (IV)

where R^2 , m, R^3 and Z^3 are as defined above, $Z^2 = -NH-$ and Q is a leaving group.

- 5 Preferred leaving groups Q include a succinimidyl group, a 4-nitrophenyloxy group, a pentafluorophenyloxy group and a tetrachloroethyloxy $CH(Cl)CCl_3$ group. The reaction may be carried out in aprotic solvents in the presence of a base, for example THF and triethylamine or acetonitrile and basic resins (Example 1).

(ii) Compounds of the formula (III) may be made starting from 4-nitrophenol optionally substituted with the group(s) $R^1_{(n)}$ (as defined above). The phenolic group is

protected as an adamantanyloxycarbonyl-derivative (by reacting the starting materials with adamantanyl-fluoroformate and triethylamine in THF at rt). The protected 4-nitrophenyl carbonate is reduced to the corresponding amine by hydrogen transfer in ethanol using ammonium formate and Pd/C 10% as catalyst at rt. The amine is then hydroxyethylated with ethylene oxide in AcOH at 20°C and then reacted to the desired nitrogen mustard. Reference may be made to EP-A-433 360 or EP-A-490970 for suitable conditions. The compounds may be purified by column chromatography. Deprotection to remove the adamantyl group may be carried out in trifluoroacetic acid.

- (iii) Alternatively, the nitrogen mustard of formula (III) may be activated as a chloroformate by treatment with phosgene or triphosgene in an aprotic solvent and triethylamine followed by coupling with a compound of formula (V):

where R^2 , m , Z^2 , R^3 and Z^3 are as defined above. This may be carried out in THF or other aprotic solvents in the presence of a base (for example triethylamine or pyridine).

- (iv) A further alternative route of synthesis of compounds of the formula (I) in which Z^1 is -O- involves direct coupling of 4-nitrophenol optionally substituted with the group(s) $R^1(m)$ (as defined above) with the compound of the formula (IV) or by reaction of the said optionally substituted 4-nitrophenol compound chloroformate with the compound of formula (VI), in which Z^2 is -NH- (see below) followed in each case by the reaction described above to convert the nitro group, via an amine, to a mustard group.

(v). A way of obtaining compound (I) where $Z^1 = -O-$ and $Z^2 = -O-$ is from nitrogen mustard (III) where $Z^4 = -O-$, by transforming it to the trimethylsilyl derivative. The silylated phenol is then coupled with a compound of formula (V) where $Z^2 = -O-$. Compound (V) is first activated as the fluoroformate with KF, phosgene and crown ether at -78°C , in an aprotic solvent (see Example 2), prior to reaction with silylated phenol.

B: Compounds of formula (I) where Z^1 is $-NH-$:

(i) Compounds of the formula (I) in which Z^1 is $-NH-$ may be made by reaction of a compound of formula (III) in which Z^4 is $-NH-$ with a linker of the formula (IV) in aprotic solvents and in the presence of a base. Compounds of the formula (III) in which Z^4 is $-NH-$ may be made from a 1-halo-4-nitrophenyl compound, optionally substituted with the group(s) $R^1_{(n)}$ (as defined above). This is converted to the corresponding 1-bis-hydroxyethylamino-4-nitrophenyl compound by reaction with diethanolamine with heat and the resulting product purified by column chromatography. The corresponding 4-nitro nitrogen mustard may be made by for example mesylation using mesyl chloride in pyridine and subsequent reaction to other halo mustards, e.g. bromo or iodo mustards if required. The 4-nitro group may be reduced by hydrogen transfer in ethanol using ammonium formate and a Pd/C 10% catalyst at 20°C .

(ii) Alternatively the 1-bis-hydroxyethylamino-4-nitrophenyl compound mentioned above can be reduced using ammonium formate and Pd/C 10% as catalyst in ethanol at 20°C to provide the corresponding phenylene-diamino derivative. This derivative can be converted into the corresponding 4-amino nitrogen mustard as described in the above paragraph, e.g. initially by reaction with mesyl chloride.

(iii) In an alternative route, the nitrogen mustard (III) $Z^4 = -NH-$ may be activated as an isocyanate by treatment with phosgene or triphosgene in an aprotic solvent followed by coupling with a compound of formula V where R^2 , m, Z^2 , R^3 and Z^3 are as defined above. The coupling may be carried out in aprotic solvents and in the presence of a catalyst, for example dibutyltin dilaurate (see Examples 3 and 4).

C: Compounds of formula (II):

(i) Compounds of the formula (II) may be obtained by coupling nitrogen mustard phenol compounds described in section A(ii) above with 4-nitrobenzyl chloroformate optionally substituted with the group(s) $R^2_{(m)}$ (as defined above) in the presence or absence of triethylamine at 20°C. This is used to provide compounds of formula (II) in which Z^1 is -O-

(ii) Alternatively aniline nitrogen mustards as described in section B(ii) above may be used with the chloroformate as described in section C(i) above. This is used to provide compounds of the formula (II) in which Z^1 is -NH-.

D: Compounds of the formula (IV) in which Z^2 is -NH-:

(i) Compounds of the formula (IV) in which Z^2 is -NH- may be made from a 4-nitro benzylic alcohol optionally substituted with the group(s) $R^2_{(m)}$ (as defined above). The hydroxyl function is protected as a pyanyl- or *t*-butyl-dimethylsilyl (TBDMSi)-ether by treatment at 20°C with 3,4-dihydropyran and pyridinium-p-toluenesulfonate (PPTS) in an aprotic solvent or with TBDMSi chloride and imidazole in dimethylformamide (DMF), respectively (Example 5). The intermediate thus obtained is reduced to the corresponding amine by hydrogen transfer in ethanol using ammonium formate and Pd/C 10% as catalyst at 20°C. This amine is converted to a glutamyl ester intermediate of formula (VI) (Example 6):

(VI)

where R^2 , m , R^3 and Z^3 are as defined above, Z^2 is $-NH-$ and Pr is the pyanyl- or *t*-butyl-dimethylsilyl (TBDMSi)-ether protecting group. This may be done by treating the amine with triphosgene and triethylamine in toluene at 60°C to provide the corresponding isocyanate, which is coupled with a glutamate derivative of formula $R^3O-C(O)-CH(NH_2)-Z^3$ where R^3 and Z are as defined above. Alternatively the corresponding glutamyl-isocyanate obtained from the corresponding glutamate by treatment with triphosgene and triethylamine in toluene at -78°C may be reacted with the amine in a one pot procedure (Example 7). Glutamate derivatives of formula $R^3O-C(O)-CH(NH_2)-Z^3$ may be obtained by reference to WO94/02450. Where necessary or desired, the group Z^3 may be converted to another group Z^3 using routine chemistry known *per se* following production of the compound of formula (VI), or after reaction of that to the compound of formula (I).

(ii) The compound of formula (VI) is deprotected to remove the TBDMSi or pyranyl groups by treatment with mild acidic media (AcOH, THF and H_2O or PPTS, EtOH, 55°C) (Example 8). This yields a compound of formula (VI) in which Pr is hydrogen. Compounds of the formula (IV) in which Q is a leaving group may be prepared using standard reactions known in the art (Example 8).

(iii) Where Q is a succinimidyl group the compound of formula (VI) where Pr is hydrogen may be treated with disuccinimidyl-carbonate and triethylamine in acetonitrile. Where a 4-nitrophenyl carbonate group is desired treatment with 4-nitrophenyl chloroformate and triethylamine in THF may be used (Example 9). A pentafluorophenyl carbonate may be added by in situ phosgenation of pentafluorophenol followed by coupling to the linker of formula (VI) in which Pr is hydrogen.

(iv) The compound of formula (VI) in which Pr is hydrogen may be obtained directly by coupling of the 4-aminobenzylic alcohol with glutamyl-isocyanate in aprotic solvents (Example 10).

E: Compounds of the formula (IV) in which Z^2 is $-O-$:

(i) The starting materials for the linkers possessing a carbamic bond are unsubstituted or substituted (with the group(s) $R^2_{(m)}$ (as defined above)) 4-hydroxy-benzylic

alcohols. These type of linkers may require an extra electron withdrawing group on the aromatic nucleus in order to undergo 1,4-elimination. The 4-hydroxy group is specifically protected as an acetate by treating the starting material with acetyl-v-triazolo-[4,5-b]pyridine, and 1N NaOH in THF at 20°C. The alcohol function of the acetate is further protected as pyran-yl- or TBDMSi-ether by the procedures described in section D above. The acetate function is then deprotected to restore the 4-hydroxy group in NaHCO₃ aq. MeOH at 20°C. The resulting phenol compounds are reacted in a one pot procedure with a protected glutamyl-isocyanate as described in section D(i) above. This yields a compound of the formula of (VI) as shown above in which Z² is -O- and Pr is the pyran-yl- or *t*-butyl-dimethylsilyl (TBDMSi)-ether protecting group.

(ii) Deprotection of this compound yields a compound of the formula (VI) in which Pr is hydrogen. This may be converted to compounds of the formula (IV) by methods analogous to those described in section D (iii) above.

(iii) An alternative procedure starts from 4-hydroxy-benzaldehyde which is protected with 1,3-propane-dithiol in the presence of BF₃·Et₂O, at room temperature, to give the 4[2'-(1',3'-S,S-dithianyl)]phenol. The coupling of the protected phenol with glutamyl isocyanate in toluene in the presence of Et₃N provides the di-*tert*-butyl.O-{4-[2'-(1',3'-S,S-dithianyl)]phenyl}oxycarbonyl-L-glutamate. The deprotection of this intermediate to the corresponding aldehyde, is carried out with Hg(ClO₄)₂ in THF at room temperature. The reduction of the aldehyde with a reducing agent like sodium cyano-borohydride yields the desired compound of formula (VI) in which Pr is hydrogen and Z² is -O- (Example 11).

(iv) Another procedure to obtain the deprotected aldehyde is by direct coupling of 4-hydroxy-benzaldehyde with the glutamyl-isocyanate (Example 12).

(v) An alternative route to the compound of formula (VI) in which Z² is -O- and Pr is hydrogen is by direct coupling of the 4-hydroxy-benzylic alcohol, as potassium phenolate (obtained from the starting material and potassium *tert*-butoxyde in the presence of crown ether) with the corresponding glutamyl-isocyanate in aprotic solvents (Example 13).

(vi) The compound of formula (IV) in which Z^2 is -O- and Q is a leaving group may be prepared using standard reactions known in the art. For example where Q is a 4-nitrophenyl carbonate group the compound of formula (VI) where Pr is hydrogen may be treated with 4-nitrophenyl chloroformate and triethylamine in THF (Example 14).

5 F: Alternative synthesis of compounds of formula (IV):

Compounds of the formula (IV) in which Q is hydrogen, fluoro, chloro, bromo or -O-(N-succinimide) may also be obtained by reference to WO95/03830 published on 9 February 1995 or WO95/02420 published 26 January 1995, the contents of which are hereby incorporated by reference.
